## Planting \*:

In late March or about 8 weeks prior to transplanting, sow seeds 1/4 inch deep in seed-starting mix. Keep soil consistently moist and warm (80-90°F) for germination (7-14 days).

Transplant out after frost when the soil is warm and weather is settled.

Transplant 12-18" apart, rows 24-36" apart.

Plant in full sun.

Well-drained, nutrient-rich soil.

Water regularly, keeping the soil evenly moist but not soggy.

## Harvest \*:

75-83 to maturity.

Pick the first peppers promptly when they reach full size to encourage further fruit set.
